

# PANTHEON™ Farming

## mobile

**PANTHEON FARMING Mobile** is the mobile app accompanying the farm management information system PANTHEON Farming. Animal and crop data can be viewed and entered directly on location. Data is automatically synchronized with the main PANTHEON Farming database in the cloud. The database can be accessed remotely by the user and the accountant to prepare financial and FADN reports.

It is very convenient to have access to data directly in the field – which is exactly what the app does. You can use it on a smartphone to access and enter data everywhere you need it.

The app connects to the server and stores data there, not on the smartphone. If there is no mobile reception, data is temporarily stored on the phone and synchronizes with the database as soon as a mobile signal is available.

This means writing everything down on paper is over. Detailed information about animals (births, movements, treatments, inseminations, etc.) or tasks (history, used materials, hours worked, etc.) can be entered directly in the field. This ensures up-to-date data and prevents duplicates.

### Benefits

The module for livestock (animal husbandry) contains different types of animals: cattle, pigs, sheep, goats and horses. Each type has individual animal records, a register of all animals, milking records (cattle, sheep and goats) and a veterinary activities journal.

## Reproduction

The mobile app allows you to see the reproduction status and history of animals. When was the last insemination, whether an animal is pregnant and when birth is expected. All relevant information can also be entered with the mobile app directly on location. Entering a birth automatically creates a new animal record and updates the database.

## Purchase and Sales of Animals

You enter all movements and sales of animals with the mobile app. Data is automatically synchronized with the master database, the central register is updated and an electronic invoice is created automatically, ready to be sent.

## Movements

All movements of animals to a different holding can be traced with the mobile app. This is stored in the database and details about individual animals can be reviewed anytime. Animals can be moved temporarily, for example to a fair and back, or to another farm in a different location.

## Animal Health

The health of animals is critical for any farm. With the program, you can record each animal's health history, diseases, treatments, medications, recurrences. Based on that, you can then better decide if an animal is worth keeping.

PANTHEON FARMING Mobile also supports crop farming activities.

Data about the farm is always available to you. You can see what has been done in the past and enter new information on location; data is promptly saved into the database. Entering information about a task right away greatly reduces the possibility of errors or duplicate records.

You can enter information about any work done right after you have finished it. Other tasks like sowing, spraying or pruning are recorded in the same way. Enter the amount of materials used (seeds, fertilizer, etc.), the time it took and who operated what machinery. This is enough to produce agri-environmental scheme reports and insight into materials usage for various crops.
